

Blueprint — Administrator Guide

A complete walkthrough of Blueprint for **Administrators**. Admins have the full app: the whole Kanban board (everyone's tasks), user management, email sync, and the five admin-only workspaces — **Dashboard, Quote Generator, Accounting (Blueprint Books), Prospects, and Competitive Landscape**.

Two roles. Blueprint has **Admin** and **PM**. PMs are limited to their own tasks on the board; admins see and run everything. If you're looking for the day-to-day board basics (cards, comments, search, theme), those work the same for both roles and are covered in depth in the **PM Guide** — this guide focuses on what's **admin-only**.

1. Signing in & who is an admin

1. Open Blueprint and click **Sign in with Microsoft** (your company account).
2. You land on the **Kanban Board** with the full sidebar and nav.

You have admin rights if **either**:

- your email is in the server's **ADMIN_EMAILS** list (these accounts are *always* admin — this is the bootstrap so the first person can provision everyone else), **or**
- an existing admin has set your role to **admin** in **User Access**.

A signed-in person with **no role** sees a "*request access*" screen until an admin provisions them.

2. The board, as an admin

The board works the same as it does for a PM (drag the **:::** grip to move cards, edit fields inline, everything auto-saves, the board live-refreshes ~every 2s). What's different with admin rights:

- **You see every task** — not just your own. (PMs only ever load tasks assigned to or created by them.)
- **Assign to anyone** — the card and New-Task **Assign to** lists include all provisioned **PM users** *plus* the supervisor roster. (PMs can only assign to Unassigned or a supervisor.) A task can also carry

several people: the dashed  chip adds extra assignees (shown as  chips, removed with ✕), and each of them sees the task in their **My Work**.

- **Inbox chips** — synced cards show a  chip marking which PM mailbox the email was flagged in. Tap a store **#tag** to filter the board, same as a PM.
- **Comment moderation** — you can **edit or delete any** comment, not just your own.

Admin controls in the sidebar / toolbar

- **Refresh now** (board toolbar) — pull flagged email right now (see §4; flagged mail also syncs on its own in the background).
- **Access Requests** — appears only when someone has asked for access; **approve** or **dismiss** each request right here (§3).
- **View User Activity** — pick a person to filter the board to **their** tasks; choose **All tasks** to go back. A read-only way to see any one PM's load.
- **User Access** — add, update, and remove users, set their role, and see who's **active this week** and each person's **last-active** time (§3).
- **Import Tasks (CSV)** — bulk-create tasks from a spreadsheet (§3).
- **Danger Zone** → **Clear All Tasks** — bulk-delete (§10).
- **Help & Guide** — opens this guide (the PDF) in a new tab. PMs get the PM guide from the same link.

3. Users, access requests & importing tasks

Three sidebar panels manage your people and bulk data.

User Access — add / update / remove people

Open the sidebar → **User Access**.

To add or update someone:

1. Enter their **Email** (e.g. `person@ravesinc.com`).
2. Enter their **Display Name** — ⚠️ this must **exactly match** the name shown in the task "Assign to" dropdown, otherwise assignment won't line up.
3. Pick a **Role** — **pm** (board, their own tasks) or **admin** (full app).
4. Click **+ Add / Update**.

To remove someone: click the ✕ next to their row.

The panel also shows **adoption at a glance**: a header line — "*N of M active this week*" — plus each person's **last-active** time (e.g. *3h ago, 2d ago, never*), so you can see who's actually using Blueprint.

Roles are stored in the database. Removing a user (and not having them in `ADMIN_EMAILS`) drops them back to the "request access" screen next time they sign in.

My Work follows the login identity. A person's **My Work** view is matched to tasks by their **sign-in email**, not their display name — so renaming someone in this panel won't break their My Work. Admins listed in `ADMIN_EMAILS` are resolved to that same email identity, so their assigned tasks carry through too.

Access Requests — approve people who asked to get in

When someone signs in but hasn't been provisioned, they now land on an "**Access Pending**" screen where they can **request access** (with an optional note about who they are). Each pending request shows up in the sidebar under **Access Requests** (with a count badge):

- **✓ Approve** — provisions them on the spot (defaulting to the **pm** role; adjust in **User Access** afterward if they should be an admin).
- **✗ Dismiss** — clears the request without granting access.

The panel only appears while there are pending requests.

Import Tasks (CSV) — bulk-create from a spreadsheet

Open **Import Tasks (CSV)** in the sidebar to create many tasks at once.

1. **Upload** a `.csv` file or **paste** CSV text into the box.
2. The columns mirror the board's **Export** file — `title`, `status`, `assigned_to`, `date`, `notes`, and more. Only `title` is required; unknown columns are ignored.
3. Click **Import**. You'll get a result line like "🟢 12 created, 1 skipped."

Tip: use **↓ Download current tasks** (in the same panel) to grab a correctly shaped file to use as your template.

4. Email sync — how emails become tasks

Blueprint turns **flagged** messages in a shared mailbox into Kanban tasks, parsing the date, assignee, quote, and a summary with AI, and attaching any files.

- **Automatic** — the server keeps a Microsoft Graph push subscription alive and also runs a safety-net sync every ~10 minutes, so flagging an email is normally all that's needed; the task appears on its own.
- **Manual** — click **Refresh now** on the board to pull immediately (useful right after flagging something). It shows a short result message when done.

A newly synced task carries its **source** (✉ sender), the parsed fields, the 📁 **inbox** chip, and a 📄 **Full Email** view; attachments appear under 📎. When an attachment is **pertinent to the work** — a bill, a schedule, even a scanned image — the AI reads it too and appends the key details to the card's summary, marked with 📎, so nobody has to open the file to know what's in it. (Files you upload by hand are *not* auto-analyzed.)

Flag-time cutoff. To avoid back-importing years of old flagged mail, Blueprint only syncs messages **flagged on or after a configured cutoff date** (set at deploy time via `EMAIL_SYNC_CUTOFF`; currently early June 2026). Anything flagged before that is ignored — so if an old flagged email never turns into a card, that's why, not a bug. (Re-flagging it doesn't move its date, since the cutoff is judged by the message's received date.)

Deleted cards stay deleted. When someone deletes a card that came from a flagged email, the sync remembers it and will **not** re-create that card — even while the email stays flagged in Outlook, and even for later replies on the same thread. Want it back? Create the task manually with 📝 **New Task**.

Mailbox, Graph permissions, and the AI key are configured at deploy time — see the project **README** and `.github/DEPLOY.md`. As an admin user you don't manage those from the UI; you just flag email and (optionally) hit Refresh.

5. Dashboard

Quote insights from the RAVES quote log plus quoted tasks from the board. Everything reacts live to the filter bar at the top.

Filters (shareable): Years, Deal size, Months, **Min decided** (the sample threshold for the win-rate charts), **Estimator**, and **Work type**. Use:

- 🔗 **Copy link** — copies the URL *with your current filters* so you can share or bookmark the exact view.

- **↓ Export CSV** — exports the currently filtered quotes.
- **Reset** — clears filters back to defaults.

Quote Summary — headline metrics: **Win Rate**, **Won Value**, **Open Pipeline**, **Expected** (open × win rate), **Total Quoted**, **Quotes**, and the current-year **Projected (FY)**.

Insights — charts: Win Rate by Estimator, Win Rate by Work Type, Won vs Lost by Deal Size, Quote Pipeline by Stage, Growth (Quoted vs Won by Year with a win-rate line), Value Concentration by Estimator (Pareto), Top Stores by Value, Quotes by Month (seasonality), and Total Quote Value by Type.

Estimator Scorecards — per-estimator quotes, win %, average deal, top work type, and total value.

Account Intelligence — per-store quote count, value, win %, and last quoted, with $\triangle$ **at-risk** flags (≥ 3 decided and winning under 40%) and a repeat-vs-first-time win-rate summary.

Needs Review — quotes that have a **PO but aren't marked Won** yet — your follow-up list.

Quote Tracker — the working list. Flip each quote between **open / won / lost**; the change saves immediately and every chart and metric above updates with it. Filter the list by **open / won / lost / all**.

Raw Task Data — the underlying task rows.

6. Quote Generator

Create a professional **proposal PDF** matching the RAVES Construction template. Each one you generate is **auto-logged** (with a sequential Quote #/year) into the quote log, so it immediately feeds the **Dashboard** analytics above.

The form is grouped into four sections:

1. **Client & project** — **Customer** (*the only required field*), Store #, Point of Contact (with suggestions), and Work Type (with suggestions).
2. **Schedule & references** — Date Sent, Bid Due Date, optional PO, and a **Sitefolio** checkbox.
3. **Pricing** — two switches control **what prints in the proposal's cost box**:
 - **Labor cost** — prints a labor line (plus a materials line when you enter one). Switching it on reveals **Labor** and **Materials** fields, and the total auto-fills from labor + materials until you type your own.
 - **Total cost** — prints the total / amount line.

A live "**Proposal cost box**" preview on the right shows *exactly* what the customer will see — including nothing at all if both switches are off. Whatever you choose, the **total quoted amount is always logged** to the quote log and Dashboard; the switches only change what the customer sees.

4. **Scope of work** — Description of work (prints on the PDF) and optional Notes.

Click **Generate proposal PDF**, then **↓ Download proposal PDF**. Use **Regenerate proposal** after edits.

7. Prospects

A warehouse **lead pipeline** that pulls **live, key-less** data near the configured search center. It now uses a free hybrid source — **OpenStreetMap** (Overpass) for warehouse/industrial buildings (size is estimated from the building footprint), plus **Oakland County's public parcel GIS** for assessed/market value and property use. No API key is required. If `USE MOCK DATA=true` is set, it runs on realistic demo data instead and shows a "**Demo data**" badge.

- **Pull controls** — set **Radius (mi)**, **Min size (sf)**, **Max size (sf)**, then **⌵ Pull prospects**. A result line reports how many were pulled / new / updated.
- **Filters** — search (address / owner / city), City, Status, and sliders for Size, Year built, and Distance. Shows the filtered count, a **Reset**, and a **↓ CSV** export.
- **Summary cards** — Showing, Avg size, Closest, Qualified.
- **Charts** — Size distribution, Top cities, Year built by decade, Distance bands, and a Pipeline status doughnut.
- **Map** — a Leaflet map with the search-radius circle and **status-colored markers**; click a marker or a row to open the detail modal.
- **Table** — sortable by any column; set each prospect's **Status** and **Assignee** inline.
- **Detail modal** — property facts (size, year, owner, use, assessed/market value), editable **status / assignee / notes**, quick links to **📍 Google Maps** and **📄 County records**, and **+ Add to Kanban board** to turn a lead into a task.

Pipeline stages: New → Contacted → Qualified → Dead.

What the free sources can and can't give you. The county layer covers **Oakland County, MI only** and **withholds legal owner names** (the **Owner** you see is the OSM occupant/operator name when present, otherwise blank). Neither source has a reliable **year built**, so that column is often —. Values come from the county (market is assessed × 2 per Michigan SEV law). Outside Oakland County you'll still get buildings and sizes from OSM, just without the parcel enrichment.

8. Competitive Landscape

A self-contained, blueprint-themed **market sheet** embedded in the page (read-only). Use it for the at-a-glance competitive/market picture; there's nothing to edit here.

9. Blueprint Books — Accounting

Blueprint's built-in **double-entry bookkeeping**: invoices and receivables, vendor bills and payables, financial statements, bank reconciliation, and a period close — all in the same app as the board and quotes, no QuickBooks round-trips. Every page shares a section nav (**Overview · Receivables · Payables · Reports · Banking**) so you're never more than one click from any part of the books.

The Overview hub

Open **Accounting** in the nav. The top of the page answers "*how are we doing?*" at a glance:

- **KPI tiles** — **Cash on hand** (with this month's change and a 6-month sparkline), **A/R outstanding** (with the overdue slice in red), **A/P outstanding** (with what's **due within 7 days**), and **Net income YTD** (with this month's figure). The A/R, A/P, and net-income tiles click through to their detail pages.
- **Revenue vs expenses** — a month-by-month chart of the last 6 months; hover a month to see exact figures and the net.
- **A/R & A/P aging** — how old your open invoices and bills are, color-graded from current (green) to 90+ days (red).
- **Recent journal entries**, a collapsible **Trial Balance** (with an in-balance check — each account links into its **register**), and the **Period close** card (below). Quick actions include 📁 **Record expense** for money spent without a bill (fuel, supplies, a permit paid on the spot).

Invoices & getting paid (Receivables)

- 📄 **Invoices** — the working list. **Filter pills** (All / Open / Overdue / Paid, with counts) plus a **search box** (customer or number). Due dates read as urgency — "*Due in 12d*", "*20d overdue*" in red with the whole row tinted — and each row carries a **payment progress bar** and the footer totals the filtered set.
- **+ New invoice** — line items with live totals and tax; or **start from a won quote** (also reachable straight from the Dashboard quote tracker's *Create invoice* → link) so the amounts and PO carry over.

- **Invoice detail** — record payments (amount / date / method) as they arrive; status moves **open** → **partial** → **paid** automatically and every payment posts its own journal entry. **↓ PDF** downloads a client-ready invoice. Attach supporting documents ( **Attachments** at the bottom of the detail page); an AI receipt scan runs on uploaded images and appends the key details to the description automatically. Made a mistake? **Void** reverses an untouched invoice outright (the reversal is dated today, so it works even into a locked period), and **"Issue a credit memo..."** reduces what's owed on a settled-in-part invoice — credits interleave with payments in one history and recompute the status.
-  **Customers** — one line per customer with invoice count, total invoiced, and outstanding balance; edit names/emails inline (renames propagate to their invoices). Any customer with a balance gets a **Statement** link — a PDF of their open invoices with ages and the total due, ready to attach to a collections email.
-  **A/R Aging** — open invoices bucketed by days past due, chart on top, click any row to open the invoice.

Bills & what you owe (Payables)

Mirrors receivables: **Bills** (same filters, urgency dates, progress bars), **+ New bill** (each line books to an expense account — job materials, subcontractors, rent...), bill detail with payments and  **document attachments** (AI-reads uploaded receipts and appends key figures), **vendor credits**, and **Void** (same rules as invoices), **↓ PDF**, **Vendors** directory, and **A/P Aging**.

+ New purchase order (PO) — create a PO for a vendor before the bill arrives: line items with quantities, unit prices, and a linked expense account. Once the goods or work come in, **convert the PO** → **bill** in one click. The PO list (**POs** in the section nav) shows outstanding, received, and closed orders with a running total.

Reports

Reports in the section nav opens the report index. The three financial statements come first, each with **one-click period buttons** (*This month · Last month · This quarter · YTD* — the balance sheet gets *Today · End of last month · End of last year*), a plain-English line explaining what the report shows, a  **Print** button that strips the app chrome for a clean handoff to your bank or accountant, and a **↓ CSV** export on every report (income statement, balance sheet, cash flow, P&L by month, job profitability, general ledger, journal, A/R aging, A/P aging).

- **Income Statement** — revenue – cost of goods sold = gross profit, less operating expenses = **net income**. Toggle **Cash basis** (top of the page) to switch from accrual to cash-basis recognition — the same statements, different timing of revenue and expense.

- **Balance Sheet** — what the business owns vs owes on a date, with a ✓ **Balanced** badge. Also respects the cash-basis toggle.
- **Cash Flow** — where cash actually moved: operations, equipment, financing.

Beyond the statements, the index carries the **working reports**:

- **Account register** — any account's transaction history with a running balance (a checkbook for every line of the chart); drill in from the trial balance, the General Ledger, or the register's own account picker.
- **P&L by month** — the income statement spread one column per month (3 / 6 / 12-month windows) — the fastest way to spot a margin drift.
- **Job profitability** — profit and margin per job. Tag invoices, bills, and expenses with a **job** name as you enter them (the field suggests every job already in use; invoices created from a won quote prefill it) and the per-job P&L builds itself.
- **General Ledger** and **Journal** — every posting grouped by account with totals, and every entry in date order with full debit/credit detail. The pair your accountant reconciles against at tax time.

Three additional reports appear in the section nav under Reports:

- **Budgets** — build an annual (or any-period) budget by account. Enter monthly or lump-sum targets, then view the **Budget vs. Actual** report — each account line shows budgeted, actual, variance, and percentage — so you can spot where the year is tracking ahead or behind.
- **Sales tax** — track collected sales tax by jurisdiction and filing period. When a period is ready, **mark it filed** to lock those entries and reset the running total. The **1099** sub-tab lists vendors whose bill totals cross the reporting threshold, with totals ready to hand to your accountant.
- **Audit log** — a time-ordered ledger of every create / edit / void / payment / close action in the books, who did it, when, and the before/after values. Non-editable; useful for disputes, reviews, and year-end attestation.

Bank deposits

Record **Undeposited Funds** — payments received but not yet physically deposited. When money comes in you post it to Undeposited Funds, then **make a deposit** to bundle one or more of those payments into a single bank line that matches what actually hits your statement. **Deposits** in the section nav lists every deposit with its date, bank account, total, and the payments included.

Bank reconciliation

Match the books to a bank statement: pick the bank account, enter the **statement date and ending balance**, then tick transactions until the **difference reads \$0.00 ✓** — only then does **Finish**

reconciliation enable. Optionally **paste your bank's CSV export** and Blueprint auto-ticks the matching amounts. Past reconciliations are listed per account.

Fixed assets & depreciation

Track long-lived property under **Assets** in the section nav. Create an asset record with its **purchase date, cost, useful life, and depreciation method** (straight-line or declining balance); Blueprint computes the annual/monthly depreciation schedule and shows **book value** and **accumulated depreciation** at any point. **Post depreciation** for a period to push the journal entries into the books, or use a **recurring journal entry** (see below) to post automatically. When you retire or sell an asset, record the **disposal** — proceeds vs. book value — and Blueprint posts the gain or loss.

Recurring transactions

Monthly rent, retainer invoices, standing vendor bills, depreciation — set them once and Blueprint posts them on schedule:

1. Fill out a normal **invoice, bill, or journal entry** form, then use "🔄 **Make this recurring...**" at the bottom: name it, pick *every N weeks/months*, and a first-run date. The schedule saves **without posting anything** until that date.
2. 🔄 **Recurring** (section nav) lists every template with its cadence, next run, and last result; **pause / resume / delete** any time (already-posted documents stay — they're real books entries). ▶ **Run now** posts anything currently due on demand.

The engine catches up missed periods, clamps month-ends sensibly (a template dated the 31st posts on Feb 28), and can never double-post an occurrence.

Period close & corrections

On the Overview hub:

- **Lock period** — blocks anything from posting on or before the chosen date (back-dating protection once a month is finalized).
- **Close year-end** — additionally posts the closing entry that rolls net income into **Retained Earnings**, then locks.

Blueprint Books is **append-only**: corrections are posted as **reversing entries**, never edits — so the audit trail is always intact. Money is stored as exact cents; the books balance to the penny or the entry doesn't post.

10. Global search & the danger zone

Global search (⌘K / Ctrl+K) — as an admin, search spans **tasks, quotes, and prospects** (PMs only get their own tasks). Match by store #, PO, vendor, assignee, customer, address, and more; ↑/↓ to move, **Enter** to open, **Esc** to close. A task result jumps to it on the board and flashes the card.

Danger Zone → **Clear All Tasks** — in the sidebar. This **permanently deletes every task** on the board. You must tick the confirmation checkbox before the button enables. Use with care — there's no undo.

11. Shared basics (same as PM)

These behave identically for both roles — see the [PM Guide](#) for the details:

- **Task cards** — statuses/colors, drag-to-move, inline editing, store filters, delete, and a bottom **tool-chip bar** ( full email ·  note ·  attachments ·  comments ·  checklist) that opens one panel at a time. **Attachments** can be **uploaded and removed**, not just downloaded — email-sourced files are purged after **30 days** (the entry stays, marked *expired*), while uploaded files are kept. Assigning a real person to a **To Do** task **auto-advances it to In Progress**.
 - **Comments** — @mentions, replies, reactions, ⌘/Ctrl+Enter to post (admins can moderate any comment).
 - **Theme** —  Light /  Dark /  System.
 - **Mobile** — ≡ menu, column pills, bottom-sheet dialogs.
 - **Saving & offline** — auto-save, ~2s live refresh, offline banner with re-sync on reconnect.
 - **Help & first run** — a **Help & Guide** link in the sidebar opens this guide (PDF). On a brand-new, empty board you'll see a **"No tasks yet"** prompt with  **New Task**, **Refresh now**, and a link to the guide instead of six empty columns.
-

Quick reference

Admin-only surfaces

Area	What it's for
Refresh now	Pull flagged email on demand
Access Requests	Approve / dismiss people asking for access
View User Activity	Filter the board to one person's tasks
User Access	Add / update / remove users + roles; last-active & WAU
Import Tasks (CSV)	Bulk-create tasks from a spreadsheet
Danger Zone → Clear All Tasks	Permanently delete all tasks
Dashboard	Quote analytics, win rates, pipeline
Quote Generator	Proposal PDFs with labor/total print toggles (auto-logged to analytics)
Accounting	Blueprint Books — invoices/A-R, bills/A-P, purchase orders, budgets, sales tax/1099, audit log, bank deposits, fixed assets, statements, reconciliation, period close
Prospects	Warehouse lead pipeline + map (live OSM + county data)
Competitive Landscape	Embedded market sheet
Infra Spend	Live Azure + Atlas + OpenAI + GitHub billing at a glance (admin-only)

Admin extras on the board

- See **all** tasks; **assign to anyone**; see 📁 **inbox** chips (synced cards).
- **Search** covers tasks + quotes + prospects.
- **Edit / delete any** comment.

Keyboard shortcuts — ⌘K / Ctrl+K search · ↑↓ move · Enter open · Esc close · ⌘/Ctrl+Enter post a comment.

Admin responsibilities & troubleshooting

- **Provisioning** — keep **User Access** current; make sure each person's **Display Name** matches their **Assign to** name. Clear the **Access Requests** queue so nobody's left waiting.
- **Sync looks stale?** — flagged mail auto-syncs, but you can always hit **Refresh now**. If nothing comes in at all, it's usually a deploy-side config issue (mailbox / Graph permissions / keys) — see

the README & DEPLOY doc.

- **An old flagged email never became a task** — expected: only mail flagged on or after the `EMAIL_SYNC_CUTOFF` date syncs (§4).
- **Prospects shows "Demo data"** — `USE MOCK DATA=true` is set; the live OSM + county source needs no key, so unset it for real results.
- **Error screen with an ID** — that reference id is logged server-side; capture it when reporting an issue so it can be traced.
